

# **The rusty planet**

**By Lia**

Do you think that Mars is hot? Well think again, that is what I thought but is not hot it is actually cold! We would think that it would be hot because of its outer layer, but it is iron and dust! In my essay I will tell you about, Life on Mars and Mar's Martian Atmosphere.

## **Life on Mars**

Once on Mars we think it had water on it but not salt water like Earth has it had fresh water on it not like Earth! Lots of astronomers use to think that Mars might have life on it, so we made rovers on put them on Mars and found no life on Mars, but people still think that if you go a little deeper that we might find some sort of life on Mars once and for all.

## **Martian Atmosphere**

The atmosphere on Mars is so thin that we cannot breathe on mars because we humans, need thick air with oxygen and not with carbon dioxide, if the atmosphere was thicker that maybe just maybe it will be hotter and will warm the frozen water and will have rivers on Mars again. The clouds on Mars are made out of water ice and dust particles. Mars is covered with sand and iron, when an asteroid hits mars instantly all over the planet in is covered with sand and dirt In the air and takes weeks for is to go back down on the rusty iron ground of Mars.

“Well I don’t know about you but I would not want to be in that dust storm!”

In conclusion I have told you about the amazing life on Mars and the crazy atmosphere on Mars. I hope that you liked my essay about Mars and its one of a kind atmosphere!
